SUMMARY

Chrońmy Przyrodę Ojczystą **72** (2): 146–151, 2016

In 2015, *Lathyrus heterophyllus* – a species considered extinct in Poland – was found in NE Poland, in Pisz Forest, in the Strzałowo Forest Division. The species was found in 2 locations, at 12 sites. A total of 445 shoots were found. The new locations probably coincides with the locations reported by botanists in 1906. At present, actions taken by the headquarters of the Strzałowo Forest Division (including grazing by Polish primitive horses) fully protect the conservation status of the *Lathyrus heterophyllus* population at the new sites.
