Słowa kluczowe: *Salicornia europaea*, nowe stanowisko, Pomorze Gdańskie, gatunki zagrożone, halofity, solniska nadmorskie.

Summary

Salicornia europaea L. is a protected and endangered species in Poland. It is also considered as locally extinct in the Gdańskie Pomerania region. Common glasswort is a halophyte that occurs among the Baltic Sea coast and in saline inland places in the Wielkopolska and Kujawy region. In July 2004 a new locality of *Salicornia europaea* L. was found in Słone Łąki nature reserve (Gdańskie Pomerania, CA39 square of the ATPOL grid) in Władysławowo. *S. europaea* grows mainly in *Juncetum gerardi* association. The accompanying species are: *Juncus gerardi*, *Agrostis stolonifera* ssp. *maritima*, *Glaux maritima*, *Triglochin maritima*, *Plantago maritima*, *Aster tripolium*, *Puccinellia distans*, *Spergularia salina*, *Festuca rubra*, *Phragmites australis*, *Bolboschoenus maritimus*, *Potentilla anserina* and *Atriplex hastata*. The locality of common glasswort is endangered by expansion of the reed grass *Phragmites australis* and needs active protection.
