

SUMMARY

New localities of *Muscari comosum* (L.) Mill. in Lublin Province

Muscari comosum was previously reported from 6 localities in Lublin Province, only four of which have been confirmed. During the research conducted between 2001 and 2006, 19 new localities of *M. comosum* were discovered. Both the previous and the newly found localities have been presented in detail in Table 1. What presents a serious threat for the population of *M. comosum* is the process of changing of thermophilous grasslands into arable land, as well as herbicide contamination. Some of the newly discovered localities of *M. comosum* deserve protection in the form of sites of ecological interest. Effective protection of the other localities, most of which are situated along roads or among fields, is practically impossible.
